EXECUTIVE SUMMARY - INCREMENTS A, B, C, D AND E

Included in this summary are the results of the Basewide Energy Systems Plan for Redstone Arsenal, Alabama. This plan includes an analysis and recommendation of energy conservation projects for the reduction of the installation's present energy consumption. The savings figures presented in this summary can only be realized after all projects have been implemented. Black & Veatch has developed projects that would meet the funding requirements for the energy conservation program. Futhermore, the recommended projects provide partial compliance with the energy conservation requirement for the installation as outlined in the Army Facilities Energy Plan. This summary presents data on the following:

- Energy use model
- Source energy reductions due to energy conservation techniques for buildings and their systems
- Application of solar energy to reduce fossil fuel consumption
- Savings utilizing central energy monitoring and control systems (EMCS)
- Use of solid waste as an alternate energy source
- The analysis of Total Energy/Selective Energy (TE/SE) systems

Tables 1 and 2 located in the Appendix present information pertaining to the physical descriptions and energy consumption of 35 typical buildings used to verify historical energy consumption in the development of the basewide energy use model. This model was then utilized as the foundation for energy conservation project analyses and recommendations. Table 3 in the Appendix summarizes the daily personnel occupancy for each typical building. Tables 1, 2 and 3 also provide information which was used to estimate source energy consumption for similar buildings within the designated groupings.

Table 4, in the Appendix, indicates the annual source energy consumed by each of the building groups used in the basewide energy use model. The estimated annual source energy consumption for all building groups calculated by the energy use model for base year 1975 was 5,196,492 mega-Btu per year. The energy use model was accurate in its prediction of the annual source energy consumption at Redstone Arsenal. The model was within 1 percent of the historical source energy consumption for FY75 shown below.

Annual Source Energy Consumption for FY75 Btu \times 10 6

Electricity	2,998,747
Natural Gas	774,039
Fuel Oil No. 2	139,381
Fuel Oil No. 5	1,293,239
TOTAL	5,205,406

Figure 1 illustrates a percentage breakdown of the annual source energy consumption from Table 4.

The total estimated source energy savings due to implementation of all feasible energy conservation projects developed within Increments A, B, C, D and E of this study is 843,810 mega-Btu per year. These projects consisted of various architectural improvements, and mechanical and electrical system modifications and are summarized in Tables 5 and 6 in the Appendix.

Table 5 lists the project number, percent of basewide reduction, and the source energy savings for the indicated building types. Figure 2 illustrates the combined effect of the recommended energy saving improvements, as compared to the FY75 source energy consumption. The estimates of 843,810 mega-Btu per year indicates a savings of approximately 16 percent over the base year (1975). Further explanation of the historical energy consumption, basewide energy model, and energy conservation analysis can be found in the Energy Use Survey. Figure 3 illustrates the allocation of the energy conservation projects savings for significant building groups.

Table 6 was developed to give a prioritized schedule, in order of fiscal year, for implementing the recommended energy conservation projects.

Utilizing solar energy, a renewable energy source, to reduce dependence on nonrenewable energy sources at Redstone Arsenal revealed

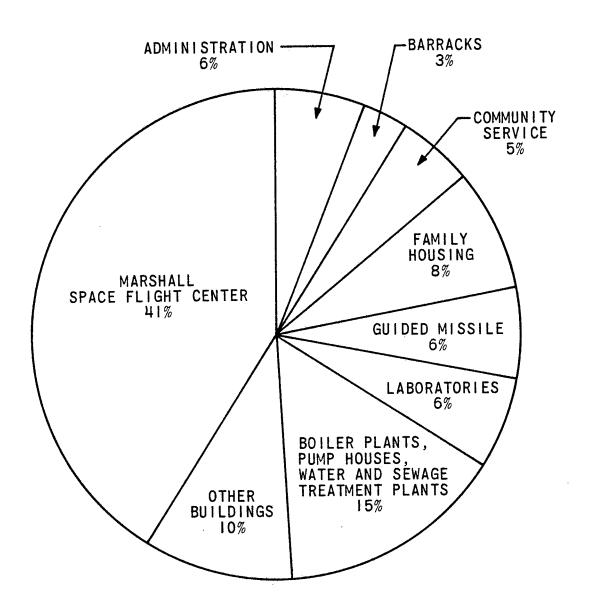

FIGURE 1

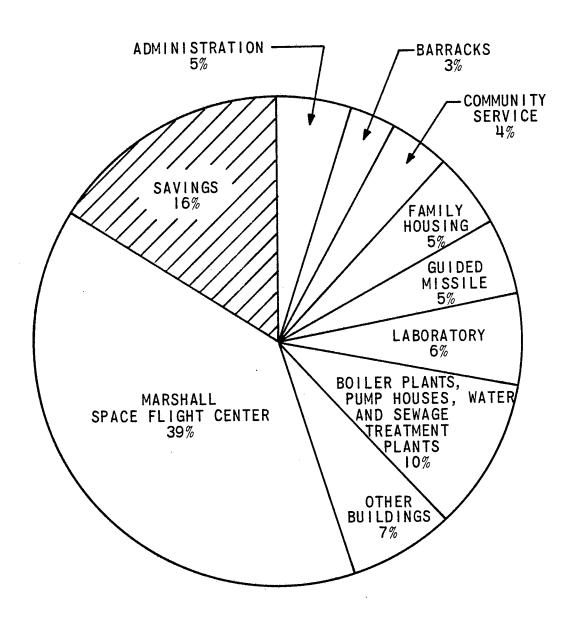

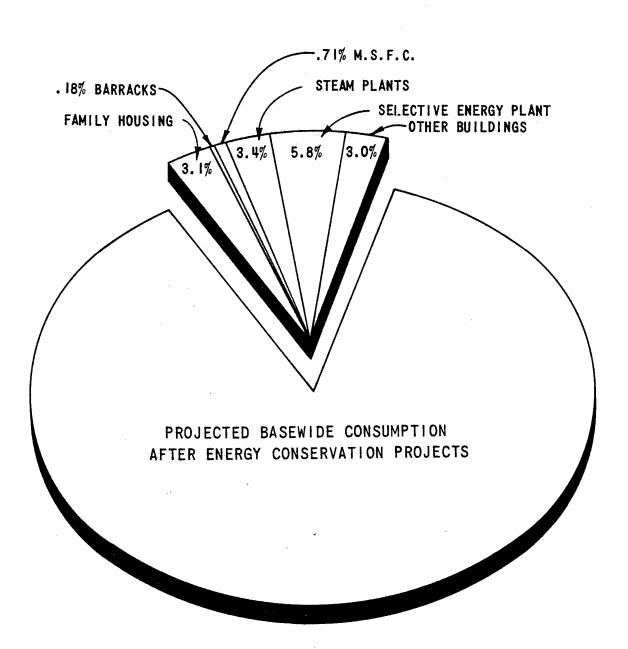

FIGURE 2

REDSTONE ARSENAL BASEWIDE SOURCE ENERGY CONSUMPTION AFTER ENERGY CONSERVATION PROJECTS

(BASE YEAR -1975)

ALLOCATION OF ENERGY CONSERVATION PROJECTS SAVINGS

FOR SIGNIFICANT BUILDING GROUPS

that the concepts investigated would be economically impracticable. Eight concepts were evaluated and are presented in the report in Volume I entitled Solar Energy Applications.

The report on Energy Monitoring and Control Systems (EMCS) study includes recommendations for the installation of an FM radio control system. This system controls residential air-conditioning units and is estimated to save 34,217 mega-Btu per year. This project is scheduled for FY83. Additional modifications to the existing EMCS system could not be justified. Additional information is provided in the EMCS report in Volume I.

Assistance was given in evaluating the use of solid waste for reducing source energy consumption at Redstone Arsenal. This project, which was recommended by others, provides for the installation of a solid waste-burning incinerator facility to provide steam to the existing steam distribution system. This facility which is presently under construction was found to be in accordance with similar facilities recommended for other installations. The facility will provide an estimated savings of 285,658 mega-Btu per year.

The analysis of Total Energy/Selective Energy (TE/SE) systems has resulted in a Selective Energy plant programmed for FY84. This plant would burn coal and provide steam to an expanded steam distribution system while generating 23 percent of the total electrical power required by Redstone Arsenal. Oil and natural gas consumption of the installation would be reduced by 53 percent. The total annual source energy savings

would be 303,342 mega-Btu per year. Detailed descriptions of the TE/SE systems analyzed are included in the <u>Total Energy</u>, <u>Selective Energy</u> and <u>Central Boiler Plants</u> report in Volume I.

EXECUTIVE SUMMARY - INCREMENTS F AND G

This is a summary of the two phases of work, Increments F and G, that were completed in December, 1982.

The purpose of Increment F of the Basewide Energy Systems Plan is to identify and develop recommendations that can be used by Redstone Arsenal in preparing its energy management plan. Increment G identifies maintenance, repair and minor construction projects for the purpose of conserving energy. These are energy conservation projects that did not meet ECIP criteria or did not fit the ECIP program at the time that Increments A, B, C, D and E of the study were completed.

The average costs of energy for FY81 are given in Table 7 in the Appendix. These costs have been used as the basis for determining the dollar savings due to energy conservation.

Recommended projects developed within the scope of Increments F and G are summarized in Tables 8 and 9 respectively (See Appendix). Projects are prioritized by their E/C ratio. The E/C ratio is defined as the ratio of yearly energy savings in million Btu to the cost estimate in thousands of dollars. Any project showing a payback of 15 years or less and a Benefit-to-Cost ratio (B/C) greater than 1.0 is recommended. Material and labor cost estimates are representative of April, 1981 prices.

Five projects were put into 1391 format to be submitted by Redstone Arsenal for possible ECIP funding.

Three projects involve work in Family Housing. The first, Reduce Infiltration in Family Housing, involves caulking the soleplate and other cracks in all units. The second project, Vent Dampers, involves installing thermally actuated vent dampers in flues of gas-fired furnaces. The third project, Sliding Glass Storm Doors, involves installing aluminum storm doors on all units with sliding glass doors.

The fourth project, Exterior Insulation and Window Reduction, involves reducing window areas and installing exterior insulation on eight buildings on post.

The fifth and final project developed for possible ECIP funding, Electrical Distribution System Improvements, involves changing the voltage of the electrical distribution system to reduce line losses.

The ECIP documentation for these projects appear in Appendix B of Volume IV.

The total estimated source energy savings due to implementation of all the recommended projects in Increment F is 319,100 mega-Btu per year. The total estimated savings due to implementation of all recommended projects in Increment G is 219,300 mega-Btu per year.

Conclusion

The projected future energy savings at Redstone Arsenal due to the scheduled ECIP projects developed under Increments A, B, C, D and E, construction of the Solid Waste Incinerator Facility, and Selective Energy Plant and recommended projects from Increments F and G is shown in Figure 4. Table 10, in the Appendix, lists the individual projects comprising the "Scheduled ECIP project" section of Figure 4.

Figure 5 represents a forecast of future energy costs at Redstone Arsenal. The graph compares how costs could escalate if no energy conservation projects are implemented versus energy costs if all cost effective projects are implemented. The energy conservation projects are assumed to be implemented in the following three phases:

Phase I - Scheduled ECIP projects

Phase II - Solid Waste Incinerator Facility
and Selective Energy Plant

Phase III - Increments F and G projects

Figure 5 does not account for new building construction.

REDSTONE ARSENAL
SCHEDULED ECIP PROJECTS SINCE FY75

Project	FY	Annual Energy Savings (10 Btu)
FM Radio Control System (FH)	80	34,217
Storm Windows and Doors (FH)	80	30,742
Improvement to Permanent Barracks	81	9,269
Add Economizers to Boilers in Building 3624	81	27,274
Oxygen Monitoring and Controls	81	25,692
Upgrade Insulation on Steam and Condensate Lines	82	115,992
Construction of Condensate Lines - 5600 Area	82	25,789
Waste Heat Recovery (FH)	83	22,901
